

Baseball Balls and Strikes

<https://advancedsqlpuzzles.com>

For this puzzle you will need to understand the rules of baseball's balls and strike count. Here is a good reference if you are unfamiliar with the rules: [Baseball: Strikes, Balls, and The Strike Zone](#)

Suppose that you have a table that contains pitch records for each at-bat. Construct an SQL query that returns the balls and strikes count before and after the pitch.

[Here is an example data set](#) of 4 at-bats and the expected outcome in the columns "Start of Pitch Count" and "End of Pitch Count".

Here is a link to my solution. Note this links to my GitHub repository.
